

## Transact -- A Full-Service E-Commerce System

Soverain's flagship product Transact is a premier e-commerce system for businesses seeking to power high-volume, high-transaction commerce websites. Transact serves a full range of e-commerce business models - including business-to-business, business-to-consumer, and information commerce – and enables e-businesses to offer physical goods, digital goods, pay-per-view, micro-transactions, and subscriptions.

*The Commerce Center is the entry point for all store management activities. The easy-to-use graphical interface helps merchants manage web store orders and ensure optimum customer service.*

### Customers

- Create Customer
- Find Customer

### Orders

- Tax Reporting

### Subscriptions

- Manage ACL
- Subscription Summary
- Manage Renewals

### Commerce Configuration

- Commerce Configuration

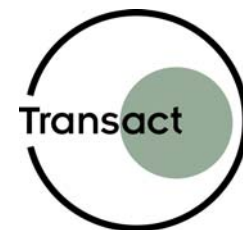

### Employee Management

- Create/Add Employee
- Find Employee
- Change your seller information

## Designed To Handle E-Commerce Complexity

Transact works with a broad array of e-businesses and supports multiple business models, payment methods, and currencies. Transact handles the complexities of Internet commerce, allowing organizations to concentrate on building an effective, successful e-business strategy including:

- **Multi-store capacity.** A single Transact installation can handle all transactions, with all of the particular business rules, for thousands of different stores within the same infrastructure. A merchant can share buyer profile credentials across all of its stores (allowing for single click checkout) and a single shopping cart (even if the cart contains items from different stores).
- **Transactional flexibility.** Because Transact can enable any type of transaction (physical or digital goods), anywhere on the Internet (not just on a single store's pages), Transact can serve as a transaction hub for companies that need to collect payment for transactions occurring outside of an online store's controlled environment – on another site's servers, via email, via CD, or through a call center application).
- **Digital goods capability.** With the continued growth of markets for digital content, publishers and other content creators need a secure, scalable way to monetize their content. Transact is designed to support the full range of information commerce -- subscription, pay per view, download, micro-transaction, and credit.

## Features And Flexibility To Grow With Your Business

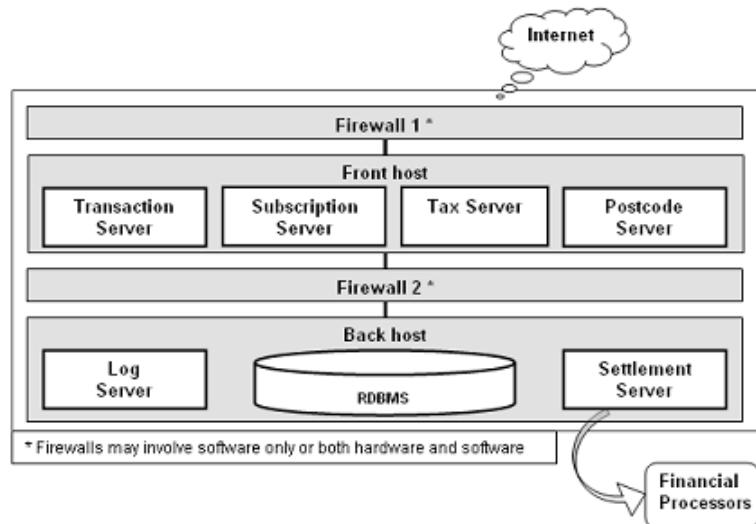

Transact has numerous features that allow our customers' websites to grow as their e-commerce strategy and business needs evolve.

- **Ease of Implementation.** Transact's design employs e-commerce industry best practices, and the resulting standardization cuts down on consulting requirements and reduces the risk, cost and time of implementing an e-commerce business.
- **Enhanced self-service.** Customized Transact SmartStatements™ enable website customers to receive complete shipping, payment, and billing information. They can also track shipping information and resolve payment problems and reset their passwords all online.
- **Enhanced online security.** Transact's SecureLink technology provides tamperproof messages and authentication, keeps sensitive information behind not one but two firewalls, and independently encrypts all customer payment credentials.
- **Architected for growth.** Transact's distributed architecture separates content management from order processing and customer service for optimal security, scalability, and manageability.

## Open, Scaleable Architecture That You Can Rely On

Transact provides an end-to-end solution for secure Internet commerce. Transact's open, scalable architecture makes it possible for the system to adapt to the evolving requirements of a merchant's e-business.

- **Transaction Server.** Features comprehensive order management, personalized online customer service, and support for multiple business models, languages and currencies.
- **Subscription Server.** Features comprehensive security and authentication capabilities by managing subscriptions and authorizing access to digital content.
- **Tax and Postcode Server.** Provides tax and postcode validations.
- **Log Server.** Features secure management of all log entries generated by the Transact server.
- **Settlement Server.** Features support for multiple payment processors and payment methods to ensure authorization of buyers to purchase as well as as the efficient transfer of funds from buyer to seller upon fulfillment.

### About Sovereain

Sovereain Software™ provides e-commerce software and services for enterprises, focusing on the publishing, news syndicate and digital content industries. Our flagship product Transact™ is a time-tested, robust e-commerce system which supports multiple storefront/merchant configurations. Sovereain's products have been deployed to customers in 25 countries, from mid-market companies to large-scale deployments. Sovereain Software is the successor to Open Market, Inc., an e-commerce software pioneer, and we are dedicated to developing and supporting that technology today.
